The increase in green house gases and the over consumption of resources are all coming together to change the very climate of the Earth. NASA has reported that as of now, climate change is nothing new. 1) What are the health and environmental implications of human activity that is contributing to the Climate change? One of the biggest areas of concern is the amount of CO₂ (carbon dioxide) that is being pumped into the air by the combustion of fossil fuels. The science community has clearly stated that there is a problem, however, there are differing opinions as to the cause of the climate change. There are countries that agree that the main cause is human activity and they have enacted laws to deal with the problem. For example, Germany has taken steps to put a cap on emissions in an effort to reduce the carbon level in the atmosphere. Many nations are starting to institute an emissions trading system to combat climate change. Many researchers, engineers and environmentalists are expressing deep concerns about changes in the overall climate of the planet. Fossil fuels. The increase in green house gases and the over consumption of resources are all coming together to change the very climate of the Earth. NASA has reported that as of now, climate change is nothing new. 2) What are the basic relationships between the climate of the Earth and the atmospheric and chemical composition of the atmosphere? 3) How does the impact of emissions of greenhouse gases into the atmosphere differ between the Northern and Southern hemispheres? 4) What are the key points of information from the data presented in the IPCC report that we should consider? 5) What is the Greenhouse Effect? 6) How has the atmospheric composition changed over time? 7) How has the atmosphere been changing over time? 8) What are the two main types of Greenhouse Effect? 9) What is the current state of the greenhouse effect? 10) What are the causes of global warming? 11) What is the role of human activity in global warming? 12) What are the different types of greenhouses gases? 13) What is the absorption of energy by the greenhouse gases? 14) How do the levels of greenhouse gases in the atmosphere affect the average temperature of the atmosphere? 15) What are the different levels of greenhouse gases and their composition? 16) What are the levels of CO₂ in the atmosphere? 17) What are the levels of CO₂ in the 82157476af
